## **DETAILED ACTION**

### ***Allowable Subject Matter***

Claim 1-9, 11, and 14-15 are allowed.

The following is an examiner's statement of reasons for allowance:

Applicants claim amendments submitted January 4, 2008 have been carefully considered in view of the accompanying arguments in Applicants filed reply. Although the amendments to independent claim 1 are not explicitly set forth in the specification as originally filed, the Examiner finds sufficient basis to support the limitations.

Specifically, Applicants disclosure teaches that the heated glass sheet is "fixed to mold (2)" and that the "glass sheet is sucked to be brought into contact with the bending surface of mold (2)" (Pg13, lines 11-27) and that the "glass sheet can be brought into contact with the entire region of the bending surface of the mold" (Pg, 9, lines 22-23). Applicant later discloses in Example 1 that at completion of bending, "the glass sheets had glass viscosities of  $10^{7.4}$  Pa\*s,  $10^{7.5}$  Pa\*s, and  $10^{7.2}$  Pa\*s".

In view of the foregoing, it is the Examiners assessment that the specification as originally filed provides adequate basis for the claim limitation requiring that "portions of the heated glass sheet having a viscosity of not lower than 10% Pa\*s and not higher than 10\*Pa\*s are pressed against the bending surface in the bending step".

In view of these newly presented limitations and the analogous limitations in newly submitted claim 14 (lines 4-5), it is the Examiners assessment that the claimed invention is no longer rendered obvious solely in view of the Tomozane reference. Specifically, the Tomozane reference discloses heating only the portion of the glass sheet intended to be bent to a temperature in the working range (e.g.  $10^5$  Pa\*s to  $10^8$  Pa\*s) while pressing unheated, rigid regions of the glass against the molding surfaces of the bending mold. In contrast, Applicants invention is understood to require the heat softened portions of the glass sheet to be placed in direct contact with the molding surfaces. On this matter, Applicants claimed invention is understood to define over the Tomozane teachings.

Now, it is necessary at point to briefly review the state of the art in glass sheet bending and to underscore the characteristics of the claimed invention which distinguish the claimed invention over the prior art. Specifically, the glass working art is replete with examples wherein the mold pressing of a flat glass sheet is controlled to yield a complexly bent final product (see for example Wolfe et. al. US 5,716,425). During such operations it is routine to heat the glass sheet into a viscous working range, to press the thus heated glass material into contact with a molding surface, and to control the bending operation in such a manner as to achieve a complexly bent substrate which is substantially free of optical defects. The Patent to Nikander et. al. (US 5,292,355) teaches a very closely related bending operation which exacts control over pressure, temperature, and bending time to achieve a similar complexly bent glass sheet.

These prior art references, by virtue of achieving a substantially identical result to Applicants disclosed process, would reasonably be expected to comply with the bending operation as defined by the claimed Formula 1 and Formula 2. That is, one of ordinary skill in the art would reasonably be expected to tailor and optimize the particular bending parameters to achieve an optimal complexly bent glass product. With this point in mind, the prior art of record does not make explicit a bending operation including an active controlling step where bending pressure, bending time, and glass temperature are subject to compliance with the mathematical relationships set forth by Formulas 1 and 2.

Restated, it is the Examiners position that the novelty of Applicants claimed invention lies not with the particular operating values of pressure, temperature, and bending time since said parameters would be subject to routine experimental optimization and Applicants specifically claimed ranges would have been derived through the normal course of process optimization. Rather the novelty of the claimed invention lies in the explicit control over these pressure, temperature, and bending time variable in such a manner as to comply with the explicit formulae set forth in claims 1 and 14.

In summary, after careful consideration of Applicants claimed invention and the relevant prior art, it is the Examiners assessment that said prior art does not teach nor reasonably suggest a method for bending a glass sheet heated to the claimed viscosity range and explicitly including a step of

Art Unit: 1791

"controlling a bending temperature T and a bending time period t for the glass sheet so as to satisfy the following formulas 1 and 2;

$$0.05 < \phi < 2.00$$

$$\phi = \int_0^t \frac{P(\tau)}{\eta(T)} d\tau$$

Where P(t) is a surface pressure difference (Unit: PA) between a pressure applied on a primary surface of the glass sheet and a pressure applied on a rear surface of the glass sheet at a time  $\tau$ , t is a bending time period (unit: s),  $\eta(T)$  is the viscosity (unit: Pa\*s) of the glass sheet at a temperature T, and T is a bending temperature (unit: °C) at the time  $\tau$ ."

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
